

Driving tips for improved environmental performance

There are many small but important ways in which you as a driver can improve your car's fuel consumption (with significant savings on fuel costs) and reduced emissions of CO₂ and other pollutants (to benefit the environment):

- Avoid using your car for short or unnecessary journeys: use public transport, cycle or walk instead.
- Plan ahead by combining trips (shopping, school runs etc.), try to use less congested routes, avoid rush hours, car share with work colleagues.
- A cold engine uses significantly more fuel than a warm engine – drive off gently as soon as possible after starting your engine and use the choke sparingly: an open choke increases fuel consumption by 50% - 100%.
- An energy-aware driving style can save you up to 13% on your fuel consumption.
- Keep your engine tuned. Have your car regularly serviced.
- Inflate tyres correctly to manufacturer's recommendation.
- Poor engine lubrication, wheel alignment and poorly adjusted brakes can all increase fuel consumption.
- An aggressive driving style can increase fuel consumption by 10% - 12% above average and increase environmental pollution by 30% - 40%.
- Avoid harsh acceleration or heavy braking which wastes fuel, whereas slowing down in good time saves fuel.
- Travel at lower speeds as high speed driving significantly increases fuel consumption. At 60 mph fuel consumption rises by 17%, at 70 mph by 29%, compared to 50 mph.
- Avoid over-revving the engine unnecessarily and drive in a gear position suitable to road conditions.
- On bends reduce speed in time and accelerate smoothly when you are halfway through a bend. Late heavy braking before a bend and rapid acceleration leads to excessive fuel consumption.
- Switch off to reduce periods of engine idling **when it is safe to do so** – Even if you only have to wait for 30 seconds, it's more economical to switch off your engine and restart it again when necessary.
- Do not carry unnecessary weights in the boot.
- Remove roof racks when not in use. A roof rack can increase fuel consumption by 40% and a cycle rack with two bicycles by 10% - 15%.

- Use air-conditioning sparingly – running air-conditioning continuously increases fuel consumption significantly.
- Be aware that the use of electrical devices increases fuel consumption, **but do not compromise safety**. The rear screen heater switched on increases consumption by 3% - 5%, so switch the demister off when the window is clear.
- Front windows half open consumes up to 5% - 10% more fuel at 70 mph compared to 50 mph. Use the air vents instead.
- The sun-roof fully open consumes up to 4% more fuel, and half-open up to 3%.
- Check your fuel consumption – it will help you get the most from the car and changes in overall fuel consumption may indicate a fault.

This advice is of a general nature. In regard to the advice on driving behaviour (speeds, acceleration, braking, cornering, switching off the engine etc.) drivers should ensure at all times that road safety is their paramount concern.

Greenhouse gas emissions and climate change

Greenhouse gases from human activities, mainly carbon dioxide (CO₂) emissions from burning fossil fuels (including petrol and diesel), have begun to cause changes to the global climate. CO₂ emissions from fossil fuels remain in the atmosphere up to 200 years or more, trapping increasing amounts of heat and preventing its escape into space.

Human influences will continue to change the composition of the atmosphere throughout the 21st century. As a result, global average temperature and sea levels are projected to increase. Predictions for temperature rise are up to 5.8°C and for sea-level rises up to 0.88 m by the end of the century.

These changes will be greater than any before in human history and climate change is globally recognised as the major environmental threat to the earth today. Unless action is taken to reduce greenhouse gas emissions the pattern of the world's

climate and weather patterns will change, giving rise to increased storms, coastal erosion, floods, droughts, heat waves etc. at potentially catastrophic cost in human and environmental terms.

The impact of climate change on Ireland will be significant but will be more damaging on many countries which are least able to afford to take action or adapt.

Ireland is committed under the UN Kyoto Protocol to limiting our rate of increase of greenhouse gas emissions to 13% above 1990 levels by 2008 – 2012. Ireland had already passed this target by 1998 and unless action is taken emissions could rise by over 35% by 2010. It is estimated that private vehicles account for 60% of all transport sector greenhouse gas emissions and freight vehicles for 35%.

CO₂ emissions from cars

Carbon dioxide (CO₂) is the main greenhouse gas contributing to climate change. CO₂ is emitted by the burning of fossil fuels in transport, space heating of homes and buildings and electricity generation. When petrol or diesel fuel is burnt to power a car engine the main by products are water vapour and CO₂ - about 100 kg CO₂ is emitted per 40 litres of petrol or diesel.

Other detrimental “local” pollutants are also produced because the burning process is not perfect e.g. oxides of nitrogen, unburnt hydrocarbons and particulate matter. Such pollutants can adversely affect human health especially in terms of exacerbating respiratory and cardio-vascular illnesses. Local pollutants are progressively being reduced through improved engine technologies and fuel quality. There are no technical “end of pipe” solutions to CO₂ emissions from vehicles – the only options are reduced driving, increased fuel efficiency and fuels with a lower carbon content.

Vehicle fuel types

Some vehicle fuels are cleaner and more efficient than others. For example, natural gas emits only 2/3 - 3/4 as much CO₂ as conventional fossil fuels such as petrol and diesel. Liquefied Petroleum Gas (LPG) emits slightly less CO₂ than petrol and perhaps the same as diesel but significantly less local pollutants such as nitrogen oxides and particulate matter.

Diesel engines are generally more fuel efficient than petrol engines, thus emitting less CO₂ per kilometre but significantly more local pollutants, especially particulate matter. Electric vehicles emit no CO₂ when in use, but the generation of electricity to power their batteries will generate significant emissions of CO₂ over the lifetime of the car unless the electricity is from renewable sources.

Already some new “hybrid” bi-fuel (petrol/electric) cars are being produced marketed which are very fuel efficient and low on CO₂ emissions. Car manufacturers are also researching improved diesel and gasoline (petrol) direct injection cars to increase fuel efficiency and reduce CO₂ emissions.

EU targets for CO₂ emissions from cars

The motor industry, too, is playing its part to reduce CO₂ emissions and car manufacturers in Europe, Japan and Korea entered into voluntary agreements with the European Commission in 1998 and 1999 to reduce average emissions of CO₂ from new cars. These agreements aim to reduce emissions significantly over the next decade. The milestone targets set are an average 120 gCO₂/km by 2005 (and 2010 at the latest) with an interim average of 140 gCO₂/km by 2008/2009 (25% reduction on 1995 levels). Also, some models must be introduced from 2000 with an average of 120 gCO₂/km. This agreement emphasises the motor industry’s recognition of its environmental obligations.

The consumer, too, can play a meaningful role in reducing CO₂. When choosing a car, you should remember that the fuel consumption of similar size cars in the same vehicle category can vary by as much as 45%. You should choose a car which suits your needs and which is as fuel-efficient as possible. This will benefit both the environment and your pocket as there are considerable fuel cost savings to be made in choosing a more fuel efficient car.

It is now mandatory under Irish and EU law for the motor industry to clearly advertise the fuel economy and CO₂ emissions of new passenger cars, allowing consumers to make informed purchasing choices on both environmental and economic grounds. This requires the placing of fuel consumption and CO₂

emissions labels on all new cars on display for sale or lease at forecourts, showrooms etc. All points of sale or lease for new cars must also display posters with this information and include it in all promotional literature and material.

This environmental information will enable consumers to see the exact fuel efficiency and CO₂ emissions of any new car and to make comparisons between makes and models before deciding on a new car purchase – to the benefit of the environment and the consumer's pocket.

EU internet guide

This guide is available on the SIMI website at www.simi.ie

The European Commission guide on the fuel economy and CO₂ emissions of new passenger cars is available on the internet at <http://europa.eu.int/comm/environment/co2/co2home.htm>

Fuel consumption test

The EU Directive 1999/100/EC provides for new internationally agreed uniform tests of fuel consumption levels in new vehicles. These new tests are more representative of actual average on-road fuel consumption than previous tests. The test is divided into two segments: urban and extra-urban cycles. Before testing, the sample cars must have been driven for at least 3,000 kilometres. Tests are conducted in a laboratory on a rolling road from a cold start.

Urban cycle

The urban test cycle consists of a series of accelerations, steady speeds, decelerations and idling. The maximum speed reached is 50 km/hr and the average speed is 19km/hr. A total distance of 4 km is covered during the test.

Extra-urban cycle

The tests for the extra-urban cycle are conducted immediately after the urban cycle. This test consists of approximately half steady speed driving with the rest consisting of accelerations, decelerations and idling. The maximum and average speeds are 120 km/hr and 63 km/hr and the distance covered is 7km.

For comparative purposes, the tables below show the ten best petrol and diesel cars in terms of CO₂ emissions.

Ten lowest CO₂ petrol vehicles

Make	Model	Engine	CO ₂ g/km	Fuel Consumption		
				Combined l/100km	Extra Urban l/100km	Urban l/100km
Daihatsu	Charade	1.0	114	6.0	4.1	4.8

Combined fuel consumption figure

The combined fuel consumption figure represents an average of the two tests with a weighting for the distance covered in each part.

How representative of real life driving are the standard tests?

The fuel consumption tests are representative of the average on-road fuel consumption. However, they are not wholly representative of real-life driving conditions because only one production car is tested as being representative of the model and therefore minor differences may arise within similar individual vehicles. There are also dramatic differences in the driving styles of all motorists and in road, car and weather conditions all of which may have an impact on fuel consumption.

Bi-fuel

Vehicles designed to run on LPG and petrol are required to be tested on both fuels. Two sets of data will be shown in such cases, one set for the vehicle running on petrol and another for the vehicle running on LPG.

Consumer choice

The following is a list of all of the makes and models currently for sale in Ireland. It provides the fuel consumption of each model in terms of litres per 100 kilometres, both in urban and extra-urban cycles, as well as a combined rate. It also provides the emissions of CO₂ of each model in grams per kilometre

Model	Urban l/100km	Extra Urban l/100km	Combined l/100km	CO ₂ g/km

Improving air quality in Europe

THE CONTRIBUTION OF THE MOTOR INDUSTRY

In the last 15 years, the introduction of electronic injection systems, three-way catalytic converters, multi-valve engines, exhaust gas recirculation and common rail injection has contributed substantially to the emergence of low-emission passenger cars and light duty vehicle engines.

As a result of these technological innovations, air quality in Europe has significantly improved and will continue to improve in the future. Soon, it will take more than 20 new cars to produce the same level of emissions as one vehicle produced in the seventies, and the industry keeps making further enormous investment in cleaner technology.

CO₂ EMISSIONS FROM CARS

In July 1998 ACEA (the European motor manufacturing organisation) finalised a ground-breaking voluntary commitment on CO₂ emissions from cars. It committed to achieve 140g CO₂/km on average for new cars by 2008. This ACEA commitment will contribute some 15% of total emissions reductions required from the EU under the 1997 Kyoto Protocol.

This booklet, produced by members of the Society of the Irish Motor Industry (SIMI), shows our commitment to increasing driver awareness.
